ReconX Documentation Index

Welcome to the complete ReconX documentation. Start here to find what you need.

📖 Main Documentation

README.md - Start Here

Complete guide covering everything at a non-technical, understandable level

- What ReconX is and how it works
- The 4-phase approach explained
- What's currently working
- What's planned for the future
- Common use cases
- Quick command reference
- ~500 lines, easy to read, no code

Read this if: You're new to ReconX or want a complete overview

---

🚀 Getting Started

Quick Start Commands

```
# Install and setup
bash setup.sh
pip3 install -r requirements.txt

# Run your first scan
python3 reconx.py -t example.com

# Query results
python3 query.py -t example.com --summary
```

Configuration

Edit `config.yaml` in the root directory to:

- Add API keys for tools (Shodan, HunterIO, etc.)
- Customize which tools to run
- Set scanning intensity levels
- Configure output preferences

📋 Documentation Breakdown

Document	Purpose	Best For
README.md	Complete overview	Everyone - start here
CAPABILITIES.md	Detailed features	Understanding what's possible
TOOLS.md	All 50+ tools documented	Deep tool knowledge
PHASES.md	4-phase workflow details	Understanding the process
USE_CASES.md	Real-world examples	Learning by example
QUICK_REFERENCE.md	Commands & syntax	Daily usage
TROUBLESHOOTING.md	Problems & solutions	When things go wrong
FAQ.md	Common questions	Quick answers

The Four Phases (Quick Overview)

Phase 1: Discovery

Finding all subdomains using 5 enumeration tools

- Status: ✅ Working
- Tools: Subfinder, Amass, assetfinder, crt.sh, WHOIS

Phase 2: Intelligence Gathering

Validating live hosts and open ports

- Status: ✅ Working
- Tools: HTTPx, DNSx, Nmap, RustScan, Masscan

Phase 3: Content Discovery

Mapping web applications and endpoints

- Status: ✅ Working
- Tools: GAU, Katana, FFUF, Dirsearch, JavaScript Parser, Waybackurls

Phase 4: Vulnerability Scanning

Testing for security vulnerabilities

- Status: ✅ Working
- Tools: Nuclei, Dalfox, SQLMap, Corsy, Gitleaks

Current Capabilities (What Works Now)

✅ **AutomationWork**

- Orchestrate 50+ security tools
- Proper sequencing of phases
- Automatic error recovery
- Resume if interrupted

✅ **Data Storage**

- Permanent SQLite database
- Searchable results
- Relationship mapping
- Deduplication

✅ **Results Access**

- Command-line querying
- CSV export
- Summary views
- Filtered searches

✅ **Flexibility**

- Run individual phases
- Scan multiple targets
- Custom configuration
- Tool selection per run

Planned Capabilities (Phase A)

🔄 **REST API**

- Programmatic access
- JSON responses
- Cloud-ready
- Integration hooks

🔄 **Web Dashboard**

- Browser-based UI
- Visual attack surface
- Real-time progress
- Interactive reports

🔄 **Report Generation**

- PDF reports
- HTML reports
- CSV data export
- Executive summaries

🔄 **Docker Support**

- Containerized deployment
- Cloud-ready
- Compose setup
- Kubernetes-compatible

🔄 **Scheduled Scanning** (Phase B)

- Recurring scans
- Change detection
- Slack/Discord alerts
- Custom alerting rules

Common Tasks

Scan a Single Domain

```
python3 reconx.py -t example.com
```

Scan Multiple Domains

```
python3 reconx.py -t example.com,other.com,third.com
```

Run Only Specific Phases

```
python3 reconx.py -t example.com --phases 1,2
```

Resume a Scan

```
python3 reconx.py -t example.com --resume
```

Query Results

```
# Get summary
python3 query.py -t example.com --summary

# List all subdomains
python3 query.py -t example.com --subdomains
```

```
# List vulnerabilities
python3 query.py -t example.com --vulnerabilities

# Export to CSV
python3 query.py -t example.com --export csv

# Find specific port
python3 query.py -t example.com --port 443
```

Tools Integrated (50+)

Discovery Tools (7)

Subfinder, Amass, assetfinder, crt.sh, WHOIS, Passive DNS, Certificate Transparency

Validation Tools (5)

HTTPx, DNSx, Nmap, RustScan, Masscan

Content Discovery Tools (8)

GAU, Katana, FFUF, Dirsearch, Feroxbuster, JavaScript Parser, Waybackurls, Commoncrawl

Scanning Tools (10+)

Nuclei, Dalfox, SQLMap, Corsy, Gitleaks, TruffleHog, and more

---

Database Structure

All results stored in SQLite with these main tables:

- **subdomains** - Discovered domains
- **ports** - Open ports and services
- **urls** - Web endpoints
- **vulnerabilities** - Found security issues
- **leaks** - Exposed secrets/data
- **tool_runs** - Execution history
- Plus metadata and relationship tables

All data is queryable and exportable.

System Requirements

Requirement	Details
Python	3.11 or higher

Requirement	Details
OS	Linux, macOS (Windows with WSL)
Storage	2GB minimum for database + tools
Network	Internet connection required
Tools	50+ tools installed during setup

Installation Methods

Method 1: Automated Setup (Recommended)

```
bash setup.sh
pip3 install -r requirements.txt
```

Method 2: Docker

Coming in Phase A

Method 3: Manual

Follow tool installation guides for each of the 50+ tools

For Different Users

I'm New to ReconX

1. Read README.md - Full overview
2. Follow quick start commands above
3. Run your first scan
4. Check QUICK_REFERENCE.md for common commands

I Want to Understand How It Works

1. Read PHASES.md - 4-phase workflow
2. Read TOOLS.md - All 50+ tools explained
3. Check CAPABILITIES.md - What's possible

I'm Running It in Production

1. Review TROUBLESHOOTING.md
2. Check USE_CASES.md for production patterns
3. Set up database backups (in `/db` folder)
4. Configure API keys in config.yaml

I Found a Problem

1. Check TROUBLESHOOTING.md first
2. Check FAQ.md for common issues
3. Review error messages carefully
4. Check tool-specific documentation

I Want to Contribute

1. Understand PHASES.md - How tools are organized
2. Review custom tool/parser examples
3. Follow contributing guidelines
4. Submit improvements

Phase A Features (Coming Soon)

When Phase A launches, you'll get:

REST API (Programmatic Access)

```
POST /api/scans - Create new scan
GET /api/scans/{id} - Get scan status
GET /api/scans/{id}/subdomains - List subdomains
GET /api/scans/{id}/vulnerabilities - List vulnerabilities
GET /api/scans/{id}/export - Export results
DELETE /api/scans/{id} - Delete scan
... and more
```

Web Dashboard

- Target list
- Active scans
- Finding explorer
- Report generator
- Settings panel

Report Generation

- PDF reports for management
- HTML reports for sharing
- CSV exports for analysis
- Executive summaries
- Technical details

Docker

```
docker-compose up
# Access at http://localhost:8000
```

Support Options

Need	Resource
How to use	README.md
Command syntax	QUICK_REFERENCE.md
Something broken	TROUBLESHOOTING.md
Quick question	FAQ.md

Need	Resource
Real-world examples	USE_CASES.md
Details on tools	TOOLS.md
How phases work	PHASES.md
Feature list	CAPABILITIES.md

Next Steps

This Week

- ☐ Install ReconX (`bash setup.sh`)
- ☐ Run a test scan (`python3 reconx.py -t example.com`)
- ☐ Query the results (`python3 query.py -t example.com --summary`)
- ☐ Explore the database (`sqlite3 db/results.db`)

This Month

- ☐ Scan your own domains
- ☐ Understand the 4-phase approach
- ☐ Set up regular scanning
- ☐ Share findings with your team

Looking Ahead

- ☐ Wait for Phase A (REST API, Dashboard, Reports)
- ☐ Plan your integration approach
- ☐ Monitor the roadmap
- ☐ Share feedback on features

Quick Links

- **Main documentation:** README.md
- **Phase details:** PHASES.md
- **Tool information:** TOOLS.md
- **Command reference:** QUICK_REFERENCE.md
- **Troubleshooting:** TROUBLESHOOTING.md
- **FAQ:** FAQ.md

Version Information

- **ReconX Version:** 1.0
- **Status:** Production Ready (CLI)
- **Phase:** A (REST API, Dashboard, Reports) planned for Q2 2026

- **Last Updated:** February 2026

Start with README.md → Run a scan → Check QUICK_REFERENCE.md for your needs

Happy reconnaissance! 🛡️
